5 **SYSTEM AND METHOD FOR ASSEMBLING DISCRETE DATA FILES INTO AN
EXECUTABLE FILE AND FOR PROCESSING THE EXECUTABLE FILE**

CROSS-REFERENCE TO RELATED APPLICATIONS

10 This application contains subject matter than may be
considered related to the subject matter disclosed in U.S. patent
application Attorney Docket No. D453:40289, entitled SYSTEM AND
METHOD FOR CONTROLLING SYNCHRONIZATION OF A TIME-BASED PRESENTATION
AND ITS ASSOCIATED ASSETS; Attorney Docket No. D453:40287, entitled
15 SYSTEM AND METHOD FOR TRANSFORMING DATA INTO A TEMPLATE-BASED
FORMAT; and Attorney Docket No. D453:39800, entitled SYSTEM AND
METHOD FOR MANIPULATION AND INTERACTION OF TIME-BASED MIXED MEDIA
FORMATS, all filed on August 31, 2000, the contents each being
hereby expressly incorporated by reference.

20 FIELD OF THE INVENTION

The present invention relates to a system and method for
collecting and assembling data for subsequent presentation to a
recipient. More particularly, the invention relates to a system
and method that provides an improved interface to facilitate the
25 creation of such a presentation.

BACKGROUND OF THE INVENTION

Information is collected and presented to people in many
30 different ways. Written text, in the form of books, newspapers,
and magazines, represents one conventional way of presenting
readers with information. Electronically, the written text, in the
form of text data, may be presented to people over a computer or

5 other similar device. For example, people may access a web site that provides news and other textual information, along with information in other media formats, such as pictures and other images.

10 Another way in which information is presented to people is via a presentation, in which a person communicates such information to a person or group of persons. To assist the presenter in communicating such information, conventionally an overhead projector is used to display a sequence of transparent slides, with each slide typically consisting of text and/or some graphical image.

15 With computers gaining in terms of popularity, such presentations are often carried out through the use of a computer running appropriate software. One example of such software is PowerPoint™ available from Microsoft Corporation. As is well known in the art, PowerPoint™ creates a series of screen slides that typically include written text, and that may include a graphical image or the like. The screens are arranged in some order as dictated by the author. During presentation, the screens are displayed, with the progression from one screen to another being controlled by the presenter, or alternatively being performed automatically by the software.

25 While such software provides significant benefits and advantages, there are still disadvantages associated therewith. For example, in a conventional presentation, the author must bring the presentation, run PowerPoint™, and carry out the presentation. In addition, there is no provision for on-demand sharing of the presentation.

30 Moreover, a drawback associated with a number of the prior art systems is that the presentation becomes relatively large, and

5 includes a large number of discrete files. Such a presentation can
become a burden to transfer. In addition, when those files are
transferred and stored on a recipient's machine, they often consume
a large amount of space, even after the recipient is finished with
the presentation. Further, in a number of prior art systems the
10 discrete files are transferred in an uncompressed format, which
increases the burden of transferring the presentation.

Thus, it would be desirable to have a system and method that
process the files comprising a presentation in such a manner so as
to create a single file of relatively small size for transferring
to a recipient. In addition, it would be desirable to have a
15 system and method that is operative to remove the presentation from
a recipient's machine after they view the presentation. Moreover,
it would be desirable to process such a file at the recipient's
machine. The present invention addresses one or more of these
desirable features.
20

SUMMARY OF THE INVENTION

The present invention provides a system and method for
creating a multi-media presentation, as well as allowing a
recipient of the presentation to search through the presentation to
25 retrieve and display desired subject matter. The invention
preferably provides software that allows an author to record audio
clips (e.g., narration) for one or more of the screens of the
presentation, in any order, and in various manners. In addition,
30 the invention maintains an internal, searchable data file with
associated timing information to allow a recipient to find desired
subject matter within the presentation, and to display the
corresponding screen(s). Moreover, the invention transforms the
plurality of files that comprise the presentation into an

5 executable file that can be viewed with a conventional web browser.

Thus, in one embodiment, the invention is directed to a method of preparing a mixed media presentation. Initially, plural sets of text data are received for insertion into respective screen slides. Audio data for one or more of the screen slides is also received. The text data and associated timing information are copied into a data file, and the text and audio data are then concatenated together and then compressed. Finally, the screen slides are converted to images, and the images and concatenated audio and text data are assembled into an executable file, along with additional controlling software.

In another embodiment, the invention is directed to a method of unpackaging and launching an executable file, including providing the executable file including executable code and a plurality of blocks of data, running the executable code to identify one of the blocks, processing identification information in the block to determine the contents of the block, reading the data in the block and creating a corresponding directory if the block is a destination directory block, decompressing the data in the block and writing the decompressed data to an appropriate directory if the block is a compressed file block, writing the data in the block to a temporary directory if the block contains a clean-up program, and saving the information in the block if the information contains auto-start path information.

30 DESCRIPTION OF THE DRAWINGS

Other features and advantages of the invention will become apparent from a description of the figures, in which:

FIG. 1 is a schematic diagram of a system for creating multi-media presentations according to one illustrative embodiment of the

5 present invention;

FIG. 2 is a flow chart depicting the operational flow of the system of FIG. 1 during the creation of a presentation;

10 FIG. 3 is a flow chart depicting in detail the exportation of data into a template-based format according to one illustrative embodiment of the invention;

FIG. 4 is a flow chart depicting in detail the assembly of a presentation into a single, executable file according to one illustrative embodiment of the invention;

15 FIG. 5 is a flow chart depicting the operational flow of an unpackaging process according to one illustrative embodiment of the invention;

FIG. 6 is a flow chart depicting the operational flow during playback of a presentation created according to the system of FIG. 1;

20 FIG. 7 is a flow chart of an event handling process according to one illustrative embodiment of the invention; and

FIGS. 8 through 13 are screen shots during creation of a multi-media presentation.

25 DETAILED DESCRIPTION OF THE INVENTION

Referring now to FIGS. 1 and 2, there is shown a system 20 for creating multi-media presentations according to one illustrative embodiment of the present invention. System 20 includes a user interface 22 including an input device 23 and display 28, a processor 24, memory 26, and microphone 30. Memory 26 stores suitable software for creating the multi-media presentations, as is described in more detail below.

30 Input device 23 of user interface 22 may take any suitable form, such as a keyboard, keypad, mouse, any other input device, or

5 any combination thereof. An author may enter text data through user interface 22, or may use the interface to select appropriate graphical information from a disk storage medium or other source, as is described in more detail below.

10 Processor 24 is connected to user interface 22, and to memory 26. Processor retrieves the presentation-creating software from memory, receives data and control commands from user interface 22, and displays the presentation information on display 28.

15 The present invention can be configured to be used, independently, by an end-user or, in the alternative, the invention can be integrated, as an add-in, into another presentation development application. In a preferred embodiment, the system of the present invention is designed for use in conjunction with Microsoft PowerPoint™. It will be understood by those skilled in the art that PowerPoint™ is merely one suitable software program
20 into which the present invention may be incorporated.

25 Referring now to FIG. 2, an illustrative method according to the invention will be described for modifying and preparing an existing presentation that consists of multiple digital assets in the form of screen slides. Operation begins at step 40, with the processor 24 retrieving the presentation-creating software from memory 26. At step 42, processor initializes the system 20. Preferably, initialization consists of setting microphone 30 as the currently selected recording object and setting the recording level to one that will result in the recording being at a desirable
30 level, such as 50%.

During initialization, processor 24 also preferably resets the size of link sound files. Preferably, processor 24 is programmed to initialize the linked sound files to a relatively large size. In a preferred embodiment, the preset size is 2 megabytes. It will

5 be understood that the file size could be made to be larger or smaller, as necessary.

10 At step 44, system 20 receives an existing presentation, either from an external source, or from memory 26. The presentation consists of a plurality of screen slides arranged in some predetermined order. In one embodiment, the first screen slide of the presentation is presented on display 28. At step 46, the author selects one of the screen slides, for example, by clicking on suitable icons in a tool bar to scroll through the screen slides, through a drop-down menu, or in any other suitable manner.

15 Once the author has selected a particular screen slide, operation proceeds to step 48, and processor 24 receives an audio clip to be linked with that screen slide. A suitable icon is preferably displayed on the screen to alert the author that they can begin speaking the desired audio clip, with the microphone 30 capturing the audio and forwarding the audio data on to processor 24. Alternatively, the audio clip can be imported from a file, disk, or the like.

20 Processor 24 stores the audio data in a suitable temporary file. In addition, processor 24 generates a link between the audio data and the corresponding screen slide, and stores that link, either with the audio clip itself, or in a separate linked file. Alternatively, the audio clip can be stored directly with the screen slide in a slide object, as described in more detail below, thereby obviating the need for any file linking.

30 In another embodiment, the author can progress through all of the slides sequentially, such as if they were making a live presentation, without the need to use the narration capture interface. The narration would be captured automatically along

5 with the slide advance timings. This embodiment is very useful for creating an archive of a live presentation at the time of the live presentation and as a by-product of the live presentation.

10 At query block 50, processor 24 determines whether there are additional slides for which an author desires to record audio clips. In one illustrative embodiment, processor may query the author whether they wish to record additional audio clips. If so, operator proceeds back to step 46, and the author selects another slide. Alternatively, processor 24 can display the screen slides sequentially, with the author deciding whether to record an audio clip for a particular screen slide when that screen slide is displayed on display 28.

15 If, on the other hand, there are no more audio clips to be recorded, then operation proceeds to step 52, and the author selects one or more of the screen slides for assembling into a final presentation, along with a desired compression format to be employed. Such selection of the slides can be done through a drop-down menu, or by scrolling through the various screen slides and selecting the desired slides, or in any other suitable manner. The selection of the compression format can be done via a drop-down or other suitable menu.

20 Once the author has finished selecting the slides for assembly, operation proceeds to step 54, and processor 24 generates a playlist object corresponding to the selected slides. The playlist object is an intermediate representation of the metadata, and contains the semantic and relationship information for the content, and is a self-contained entity that consists of both data and procedures to manipulate the data. The playlist object includes a media object to store the audio clips, a screen slide object to store the screen images, and a text object to store the

5 text contained in the various screen slides. The media, text, and screen objects also store timing information that defines the temporal relationships between the respective types of data, as is described in more detail below.

10 Then, at step 56, processor 24 copies the text from the selected screen slides as searchable text data into the text object. The text for each slide may be preceded by an appropriate header or the like so that a link is maintained between the text data and the particular screen slide from which that text data originated. At step 58, the individual audio files from each of
15 the selected screen slides are extracted from the respective slide objects and are concatenated into a single audio file which is stored in the media object. The single audio file is then compressed using the particular compression format previously selected by the author, at step 60. Thus, by allowing the author
20 to select the compression format and then compressing the audio file after concatenating the individual audio clips together, the author may to some extent control the file size and sound quality.

25 Alternatively, instead of "physically" concatenating the audio files together as described above, a new file may be created that maintains plural links to the respective audio files. This is an alternate version of concatenation that may be used in connection with the invention.

30 At step 62, slide timing information from the selected slides is extracted from each slide object, and the information is stored in a suitable file. For example, each screen slide will have timing information relating to the start and stop times that the screen slide is to be displayed, which serves to determine the order in which the screen slides are to be displayed.

5 Then, at step 64, the selected screen slides are saved in a graphics file format, preferably in Graphics Interchange Format ("GIF") format, and stored in the screen slide object. It will be apparent to those skilled in the art that other suitable graphics file formats may also be used.

10 At step 66, processor 24 assembles the selected screen slides, in GIF or some other format, with the corresponding audio files, text file, and the file containing the timing information, to create a single compressed, executable file. The process of forming the single executable file is described in greater detail below in connection with FIG. 4. The executable file may then be
15 forwarded to one or more recipients for subsequent viewing of the presentation. For example, the file can be a Windows® 98 or Windows® NT standard executable file, as is well known to those skilled in the art. As is well known, an executable file is a
20 binary file containing a program in machine language that is ready to be executed when the file is selected. In that manner, the executable file may be opened within a suitable web browser or directly in the operating system interface without the need for the presentation software that was used to create the presentation, as
25 is described in greater detail below in connection with FIG. 3.

 It will be apparent that the system 20 may be used with appropriate software to create the entire presentation at one time. Thus, rather than retrieving a multi-media presentation, system 20 can present an author with blank templates, into which the desired
30 text and/or graphical data can be entered. Audio clips can then be recorded for one or more of the created slides, either concurrently with the creation of the slide, or after the slides are completed.

5 Referring to FIG. 3, an export process that is used to process
data contained in the playlist object is described in detail. The
export process is designed to transform the data into a template-
defined data format suitable for display within a browser. The
export process utilizes a plurality of text templates and slide
10 page templates to arrange the meta data from the playlist object
such that it is in a browser-suitable format, so that the
presentation can be displayed in a browser without the need for the
presentation software used to create the presentation. In
addition, executable java scripts and applets are generated and
15 inserted into the template, and are run in the browser to allow for
the presentation to be displayed in the browser.

The export process begins at step 70, with processor 24
retrieving the playlist object with the slides and clips in
temporal order. At step 72, the export process retrieves a
20 template from the set of templates. For example, the template may
be a text information file that will contain information describing
how the meta data from the playlist object needs to be formatted
into a format that is suitable for running in the browser. In
addition, the template contains information relating to the layout
25 of the presentation, for example, the relative locations on the
display of the slides, table of contents, media player controls,
search results, and the like. The template also will contain
formatting information, for example, text font, size, color, and
similar attributes. Moreover, the template also contains
30 references to other files that are used in the display of the
presentation.

At step 74, the export process processes the command
parameters contained in the template to determine what type of file

5 it is, and the destination of the completed file. At step 76, the
export process reads the first tag in the template. The tag serves
as a text replacement holder. For example, the first tag may
instruct the export process to process the table of contents
information, the text information, or the slide page information.
10 Within the first tag there are a number of subordinate tags (i.e.,
there is a hierarchy of inner and outer loops of tags). Thus,
where the first tag corresponds to the table of contents, there
will be multiple entries to be processed, such as the title of each
slide. Then, for the first title, there are plural tags in the
15 template to be replaced with corresponding data from the playlist
object. For example, the tags may correspond to character font,
size, spacing, positioning, and the like. Thus, each tag is
replaced by the corresponding information contained in the playlist
object. In the case where the template is a text template,
20 processor 24 retrieves the text-related meta data and inserts that
information into the template. Likewise, in the case of a slide
page template, the corresponding meta data relating to the slide is
retrieved and inserted into the appropriate location of the
template based on the tags in the template.

25 Thus, at step 78, based on the particular tag read by the
export process, corresponding meta data is retrieved from the
playlist object and inserted into the template, along with
references to the appropriate files, for example, a slide file or
the data file containing the actual text data. At query block 80,
30 the export process determines whether there are additional tags
remaining in the template to be replaced with information from the
playlist object. If so, operation proceeds back to step 76.

5 On the other hand, if all of the tags have been replaced for
a particular template, operation instead proceeds to query block
82, and the export process determines whether there are additional
templates to be processed. If so, operation proceeds back to step
72. If not, operation proceeds to step 84, and the export process
10 searches for .tpl files (i.e., template files). For each .tpl
file, the export process creates a new file for each slide and
replaces an internal tag with the name of the graphic file. The
process then terminates.

15 Thus, by processing the data using the export process and the
template-defined format, the presentation may be viewed in a
conventional web browser. Thus, a recipient of the presentation
need not have PowerPoint™ software in order to view the
presentation.

20 Referring now to FIG. 4, the process of packaging the files
into a single, executable file is described in detail. Operation
begins at step 90, with processor 24 receiving input from the
author regarding packaging information and preferences. For
example, the author is prompted to input an output file name, the
name of the directory to be packaged (i.e., where the respective
25 files are currently stored), a directory name where the unpackaged
files should be stored, an auto-start file (i.e., the first file to
be opened when the executable file is selected), and package
identification information to uniquely identify the package and its
source or origin. At step 92, processor 24 creates and opens an
30 output file into which the single file will be stored.

At step 94, executable code is copied to the output file. As
is well known in the art, the executable code is the code that is
run when an executable file is selected. The executable code

5 controls the unpackaging process, as is described in more detail below in connection with FIG. 5.

10 At step 96, in the event that package identification information was input by the author, corresponding block identification information and package identification information is written to the output file. The information preferably consists of a starting block flag, block identification information, and the package identification information itself.

15 Operation then proceeds to step 98, and the destination directory information is stored in the output file, along with a starting block flag and block identification information to identify the contents of the block. Following the identification information, a data string (e.g., a 16-bit string) is written to the output file, which indicates the length of the directory information. And finally, the destination directory information
20 itself is written to the output file.

25 Then, at step 100, each file in the directory to be packaged is sequentially processed and written to the output file as an individual block. As described above, an author will have previously selected a number of the screen slides to be included in the presentation. Processor 24 accesses the playlist object and retrieves the GIF files for the selected slides from the screen slide object, the single concatenated and compressed audio file from the media object, and the data file containing the corresponding text data from the text object. In addition,
30 processor 24 retrieves the file containing the timing information for the selected slides.

At step 100, for each file a starting block flag is written to the output file. File identification information is then stored to

5 identify the file. Next, the string length of the file name is written to the output file, followed by the file name itself. Then, processor 24 determines whether the file is compressed: if not, the file is compressed and stored in a temporary location. Processor 24 next writes information (preferably 32 bits) relating
10 to the size of the compressed file to the output file. Finally, the compressed file is written to the output file, either from the temporary location, or from the originating directory. If a temporary file was created, it is then deleted.

Operation then proceeds to query block 102, and processor 24
15 determines whether the unpackaging directory is a temporary file. If not, operation proceeds to query block 106. If so, operation instead proceeds to step 104, and a clean-up program is retrieved by processor 24 to be included in the output file. The clean-up program is an executable file upon being expanded, and is operative
20 to delete the files contained in a particular temporary file. In this manner, the expanded files contained within the executable file do not permanently occupy memory on the recipient's machine, unless the presentation is intended to be permanently saved on the recipient's machine, in which case a destination directory other
25 than the temporary directory is selected.

Storage of the clean-up program is as follows: first, a starting block flag and clean-up program identification information are written to the output file. Then, the clean-up program is compressed to a temporary location in memory. The length of the
30 compressed program is written to the output file, followed by the copy of the compressed program. The temporary compressed file is then deleted, and operation proceeds to query block 106.

5 At query block 106, processor 24 determines whether one of the
files in the bundle was designated as an auto-start file. If not,
operation terminates at step 110 with the closing of the output
file. On the other hand, if one of the files was designated as an
10 auto-start file, then operation instead proceeds to step 108, and
starting block flag and auto-start identification information is
written to the output file, followed by a 16-bit string to indicate
the length of the auto-start string name, which is followed by the
auto-start string itself. Operation then terminates at step 110,
and the output file is closed.

15 In an alternative embodiment, the package process inserts a
source-identifying block into the package, with such block serving
to identify the source of the package. In this manner, the
unpackaging process described below can verify the source of the
package to ensure that the package does not contain any potentially
20 harmful or offensive data.

 Referring now to FIG. 5, the unpackaging of the packaged
presentation is described in more detail. As is described above,
a presentation is packaged into a single, executable file. The
executable file may then be transferred to one or more recipients
25 in various ways, either as an email attachment over a
communications network, on a disk, or in any other suitable manner.

 In another embodiment, the executable file is transferred to
a host web site, where the file is unpackaged as described below
and made available to recipients over the Internet or some other
30 communication network. In that situation, the recipient need not
unpack the presentation on their desktop; rather, the unpackaged
presentation may be streamed to the recipient slide-by-slide on an
on-demand basis.

5 In the case where the executable file is delivered directly to
the recipient, operation begins at step 120, with the recipient
selecting the executable file, for example, by double clicking on
an appropriate icon on the recipient's display. Once the recipient
selects the executable file, operation proceeds to step 122, and
10 the executable code in the file automatically runs and scans the
data in the output file until it encounters the first starting
block flag. Next, the executable code determines the identity of
the data contained in the first block, by reviewing the
identification information stored in the block during the packaging
15 process.

 At query block 124, if the block is determined to be the
package identification block, then operation proceeds directly to
query block 146 to scan the data for the next block in the file.
The package identification block is not processed by the executable
code during the unpackaging process. If the block is determined to
20 not be the package identification block, then operation proceeds to
query block 126, and the executable code determines whether the
block contains unpackaging directory information. If so, then
operation proceeds to step 128, and the executable code reads the
information contained in the block to determine the full path name
25 of the output directory and subdirectories in which to store the
files expanded during the unpackaging process. The code then
creates all of the necessary directories and subdirectories into
which the expanded files will be stored. Operation then proceeds
to query block 130, and the executable code determines whether the
30 directory into which the files will be saved is a temporary
directory. If not, operation proceeds to query block 146. If in
fact the directory is a temporary directory, then operation

5 proceeds to step 132, and a registry entry is created to control the clean-up program to be executed the next time the recipient logs in to their machine. Operation then proceeds to query block 146.

10 If at query block 126 the data block is determined to not be a directory information block, then operation proceeds to query block 134, and the executable code determines whether the block is a compressed file block. If it is, then operation proceeds to step 136, and the file name for that file is read from the block and concatenated with the destination directory. The executable code
15 then determines whether a corresponding subdirectory exists and, if not, the subdirectory is created and opened. The length of the compressed file is determined, and if the data needs to be decompressed, it is decompressed and written to the destination directory. Operation then proceeds to query block 146.

20 If at query block 134 the block is determined to not be a compressed file, then at query block 138 the code determines whether the block contains the clean-up program. If so, operation proceeds to query block 140, and it is then determined whether the clean-up program is needed or not, by checking the machine's
25 temporary directory to determine whether a copy of the program is already resident on the machine. If so, operation proceeds to query block 146. On the other hand, if there is no resident copy of the program, operation instead proceeds to step 142, and the clean-up program is decompressed to an executable file in a
30 temporary directory, such as the Windows temporary directory. Operation then proceeds to query block 146.

If the block does not contain the clean-up program, then operation proceeds to step 144, and the executable code determines

5 that the block contains the auto-start file information, and the code saves the path information of the auto-start file for future use. Operation then proceeds to query block 146.

10 At query block 146, the executable code determines whether there are additional blocks to be unpackaged. If so, the code reads the identification information of the next block at step 148, and operation then proceeds back to query block 124 to determine the block type.

15 If at query block 146 it is determined that there are no more blocks to be unpackaged, then operation proceeds to query block 150, and the code determines whether there is a file designated as the auto-start file, by checking for auto-start path information. If there is an auto-start file, then operation proceeds to step 152, and the corresponding file is opened to begin the presentation.

20 Where the packaged presentation is transferred to an ASP host, the host is programmed to override the auto-start data and the destination directory information. The host preferably includes codes that investigate the package identification information to ensure that the executable file was generated by a known, trusted source, and not by some unknown entity that might be transmitting a virus or other undesirable content. Once the identity of the author is verified, the package is then unpackaged to a destination directory as determined by the host, and the host stores the presentation until a user accesses the host and requests the presentation. The host can then stream the presentation to the user in any suitable, well known manner as described above.

Referring now to FIG. 6, playback of the created presentation is described in more detail. Initially, the presentation is

5 obtained by an intended recipient, either on a disk or other
storage medium, as an email attachment, or transferred over a
computer network, such as over the Internet. Then, at step 200,
the recipient opens the file by clicking on a suitable icon
representing the presentation, or in any other well-known manner.
10 As described above, when the bundle is extracted by the recipient
opening the self-executing file, one of the sub-files is designated
as the initial file to be opened, as in conventional in self-
executing files. In addition, the extracted files are written to
the appropriate destinations for subsequent retrieval during the
15 presentation.

At step 202, the presentation is displayed to the recipient,
with the slides being sequentially displayed along with any
corresponding audio clips for the respective slides. In addition,
a table of contents is displayed on the display, and includes the
20 title of each slide in the presentation (FIG. 13). The titles may
be selected by the recipient to advance the presentation to the
corresponding slide. At query block 204, the recipient's machine
(hereinafter "the machine") determines whether the recipient has
requested a search for a particular text string within the
25 presentation. In one embodiment, such a request is made by
entering the text string in an appropriate box on the screen and
then clicking on a corresponding button on the screen (see FIG.
13). If the recipient does not request a search for text, then
operation proceeds to query block 205, and the machine determines
30 whether the recipient has made a selection of one of the slide
titles in the table of contents. If so, the presentation is
advanced to the selected slide, and that slide is displayed along
with the corresponding portion of the concatenated audio file, at

5 step 206. A time-based index into the concatenated audio file is
 provided, and instructions are transmitted to reposition an audio
 player to the appropriate point in the audio file based on the
 time-based relationship between the slide and the audio file.
 Operation then proceeds back to query block 204. If the recipient
 10 does not select any of the titles in the table of contents, then
 operation instead proceeds to step 207, and the presentation
 continues to completion, and operation then terminates.

If, on the other hand, the recipient makes a request for a
 text search, operation proceeds to step 208, and the recipient
 15 enters their text string, which is received by system 20. At step
 209, the machine accesses the meta data file that was included in
 the self-executing file and that contains all of the meta data
 information necessary for playback, including the text that appears
 on the individual slides. At step 210, the machine compares the
 20 text string with the text contained in the data file. At query
 block 212, the machine determines whether a match exists. If not,
 then at step 214 the recipient is notified that there is no match
 for the entered text string. Operation then proceeds back to step
 204, and the recipient may enter another text string to be
 25 searched.

If there is a match between the text string and the text in
 the data file, operation proceeds to step 216, and the machine
 retrieves the appropriate GIF file and determines the corresponding
 position within the single audio file and presents the screen slide
 30 and corresponding portion of the audio file to the recipient.
 There are many well-known ways in which system may determine the
 appropriate GIF file to retrieve. For example, an association

5 table may be maintained to link the text of each slide with a corresponding GIF file.

It will be apparent that a recipient may request that a search be conducted before the presentation begins, during the presentation, or after the presentation is completed.

10 Once the slide and corresponding portion of the audio file are presented to the recipient, the presentation may be continued, sequentially from the selected slide to the end of the presentation, operation may terminate, or operation may proceed back to query block 204 to allow the recipient to search for another text string.

15 Referring to FIG. 7, the operational flow of event handling software included in one illustrative embodiment of the invention is shown in detail. The event handling software controls the navigation through a presentation at the recipient's machine. The software relies on a set of event data that contains all of the information relating to the timing of the presentation. For example, the event data includes information concerning the start and stop times of each slide page, of each of the clips in a clip list, and of each audio clip. In addition, the event data may include information concerning when the presentation should automatically pause or skip to a new position.

20 Operation of the event handling software begins at step 220, and the presentation begins, for example, when the self-executing file is opened. The presentation then begins to be displayed, for example, at the beginning of the presentation. At step 222, the recipient's machine is controlled by the event handling software to determine the time of the current position of the presentation. For example, when the presentation is launched from the beginning,

5 the software determines that the time is either at time zero or
only a few milliseconds. At step 224, the time is compared with
the event data for the respective slides, and the slide whose time
is either equal to or less than the determined time is selected and
displayed in the slide window on the recipient's machine, at step
10 226.

At step 228, the event handler software calculates a timeout
based on the current time of the presentation and the stop time of
the slide being displayed. At step 230, the event handler sets a
clock to fire an event trigger upon reaching the timeout.

15 At query block 232, the event handler determines whether the
event trigger has fired. If so, then operation proceeds to step
234, and the event trigger initiates a polling process to
repeatedly (e.g., every 200 milliseconds) determine the current
position of the presentation. At step 236, the current position is
20 compared with the event data for the respective slides. At step
238, the slide whose time is 1) equal to or 2) less than, and
closest in time to, the current time is selected and the slide
window is updated with the selected slide. At step 240, the event
handler calculates a timeout based on the current time and the stop
25 time of the slide, and resets the clock to fire an event trigger
upon reaching the new timeout. Operation then proceeds back to
query block 232.

On the other hand, if at query block 232 it is determined that
the event trigger has not yet fired, operation instead proceeds to
30 query block 242, and the event handler determines whether the
presentation has been either paused or stopped by the recipient,
for example, by clicking on a pause or stop button, or by selecting
another slide for presentation. If not, operation loops back to

5 query block 232. If the presentation has been paused or stopped,
 then operation proceeds to step 244, and the presentation is
 stopped. Also, the event trigger clock is cleared. Operation then
 proceeds to query block 246, and the event handler determines
 whether the presentation has been restarted, for example, by the
 10 recipient pressing a start button, or repressing the pause button.
 If the presentation has been restarted, operation proceeds back to
 step 222 to determine the time of the new position of the
 presentation.

15 It will be understood that when the recipient selects a new
 slide for display, the presentation is automatically restarted at
 step 246, and operation then proceeds back to step 222.

20 The above description of the event handler deals primarily
 with the screen slides themselves. However, it will be apparent to
 those skilled in the art that the event handler would perform the
 same functions for synchronizing the display of textual
 information, audio clips, and the like.

25 Referring now to FIGS. 8 through 13, there is shown one
 illustrative embodiment of various interface screens generated by
 system 20 to facilitate creation of a multi-media presentation by
 an author. As shown in FIG. 8, system 20 preferably displays each
 of the generated screen slides 21 with the accompanying text for
 each. In addition, a user interface window 320 is provided to
 guide an author through the process of creating a multi-media
 presentation. The user interface navigates the author through the
 30 steps of initializing the system 20, recording narration for the
 respective slides 21, previewing a presentation, and packaging the
 final presentation. The user interface 320 includes a Cancel
 button 322, a Back button 324, a Next button 326, and a Finish

5 button 328 to allow the author to control navigation through the process.

10 FIG. 9 shows a user interface 330 which may be used by an author to calibrate the microphone. The calibration of the microphone is performed by providing a volume control 332 that can be manipulated by the author to adjust the volume of the microphone. The range of control spans from 0 to 100%. The screen preferably displays the control level at which the microphone is set in a display window 334. The level can be increased and decreased by manipulating a slide bar 335. To test the volume level to determine whether it is acceptable, a control panel 336 is provided that enables the author to record and then play back a test clip to determine if the volume level of the microphone is acceptable. Control panel 336 preferably has a record button 338, play button 340 and stop button 342. To test the microphone, the author clicks the record button 338 and speaks into the microphone. When the author is finished recording, the stop button 342 is pressed. The author can listen to the recording by clicking the play button 340. When the volume level has been set to a desirable level, the author can click the NEXT button 326 to continue with the creation of a presentation. If, at any time, the author wants to return to a previous window to change a setting, the author can do so by clicking the BACK button 324.

30 FIG. 10 illustrates a user interface 350 that assists the author in narrating a slide. To begin recording on a particular slide, RECORD button 352 is clicked. The author can stop the recording at anytime by clicking on STOP button 354. The author can also pause the recording by pressing PAUSE button 356. The author can play back the recording by clicking on PLAY button 358

5 to ensure that the audio clip is audible and clear. If the content
is not as desired, the author can override the previous audio clip
by recording over it. In addition, interface 350 includes Previous
and Next Slide Buttons 357 and 359, which allow the author to
navigate through the respective slides 21. Thus, the present
10 system allows the author to record the slides out of order, giving
the author greater independence in working on the slides in the
order desired by the author and, not necessarily, in the order that
the slides appear in the presentation material.

15 When finished narrating a slide, the author can proceed to the
next slide by clicking on NEXT slide button 359, or to a previous
slide by clicking on PREVIOUS slide button 357. The activation of
either of those buttons will automatically terminate the narration
for that slide. Thus, it will be apparent that user interface 350
allows the author to record narration for the respective slides in
20 any order. The audio for each slide is independent of the other
slides, and thus, the audio for the slides can be recorded in an
order independent of the order of the slides.

25 The interface 350 preferably includes a slide time meter 364
that displays the length of the audio for each slide and a total
time meter 366 that displays the length of the audio for the entire
presentation. This allows the author to keep track of the length
of the entire presentation as the author is recording the audio for
each slide.

30 In addition to providing information regarding the length of
the audio recordings on interface 350, the length of the various
audio recordings are also provided as time meter displays 367 under
each slide. This enables the author to view the audio recording
length for all of the slides simultaneously.

5 In one embodiment, system 20 requires that narration be recorded for each slide, with the length of the recording determining the length of time for which the slide will be displayed. Alternatively, if narration is not recorded for a particular slide or slides, a default display time may be assigned to that slide, such as 4 seconds or some other amount of time. Or, system 20 may query the author to enter a default time for a particular slide for which no narration has been recorded.

FIG. 11 shows a user interface 360 that allows an author to preview and/or package a finished presentation. Interface 360 includes a Preview button 362, which if clicked causes system 20 to launch the presentation immediately, so as to allow the author to preview the presentation before completion. The presentation material can be packaged so as to be optimized for sound quality or optimized for size. The author makes their selection by clicking on one of two windows 365 and 367. Clicking on the preview button causes the processor 24 to carry out the concatenating, compressing, and export processes so as to have the data in a format suitable for presentation within the web browser. In addition, the preview function causes the processor to launch the auto-start file in the web browser automatically, as would be done by the unpackaging process described above.

FIG. 12 depicts a user interface 370 to allow the author to select a file name under which the presentation will be stored. In a preferred embodiment, optimizing the presentation for size provides a compression of about 6500 bits per second, whereas optimizing for sound quality provides a compression of about 8500 bits per second. In the embodiment shown in FIGS. 9 and 10, the user interfaces 360 and 370 only allow the author two choices for

5 optimization, namely, optimization for sound quality and
optimization for size. The system, however, can be adapted to
provide additional optimization choices to the author. For
instance, if authors desire a different level of audio, e.g., audio
at a high bandwidth to facilitate high quality CD recording, the
10 system can be adapted to provide additional optimization choices to
the author. The optimization for sound quality and size are
preferable for presentation materials that mainly contain audio
consisting of the spoken word. In the case of audio containing
spoken word, the frequency response is small and telephone-like,
15 monaural quality is the audio level that is required to be provided
by the system.

User interface 370 assists the author in saving the
presentation material. In one illustrative embodiment, system 20
keeps track of the last used directory 374 and displays the
20 directory name in the "save file as" window 372. That directory is
concatenated with the current name 376 of the presentation material
to create the file name for the presentation. For instance, user
interface 370 displays a directory of "D:\MyDocuments\" and a file
name of "testing of hotfoot.exe." The presentation material is
25 thus saved in the specified directory under the specified file
name. User interface also includes a Browse button 378 to allow an
author to select another path in which to store the presentation.
In yet another embodiment, system 20 inserts a default directory
into window 372, rather than the last-used directory.

30 As is described above, the creation of the playlist object
allows the system of the present invention to be compatible with
numerous other applications because the playlist object simplifies,
generalizes, and abstracts the process of data storage, post-

5 processing, and transmission. Thus, the playlist can be reused in
other applications, while the playlist ensures the referential
integrity, provides object modeling, provides consistency between
what is done in the present system with other applications, which
allows efficient and compatible data sharing between different
10 applications.

The system loops through each slide, extracts the text of the
slide, and removes the megaphone object from each slide and exports
it as a .gif file. The exportation of the slide object as a .gif
file can be done by using Microsoft PowerPoint™. Auto-numbering
15 is automatically turned off by the system so as not to get a "1" at
the bottom of each page. The duration of the audio file for each
file is measured and, if the slide has no audio duration, a
duration of four seconds is assigned. The reason for assigning a
four second duration is that the recipient's application is
20 responsible for advancing the slides. If there is no audio
recorded for the slide, the slide will be shown for four seconds
and then is automatically advanced to the next slide.

The corresponding audio clips for the selected slides are also
retrieved and saved as .wav files. The .wav files are concatenated
and integrated together. The .wav files can also be converted to
25 other digital media continuous stream formats, such as MP3. It
will be apparent to those skilled in the art that by concatenating
the files together, prior to encoding into another digital sound
format, the notion of independent audio linked to slides is
transformed into a coherent and unchangeable presentation format.
30 The coherent format allows the recipient to jump from slide to
slide randomly and out of order but does not allow the recipient to

5 modify or change the audio or the slides. Therefore, the intention of the publisher is preserved.

10 In one illustrative embodiment, the .wav file is converted to a Windows Media file and the bit rate is set to the bit rate previously determined by choosing optimization for size or sound quality. The Windows Media file is a single media file that can be attached to the playlist object.

15 The author has the option of choosing which slides will be included in the presentation package, with such selections being done in any suitable manner, such as by clicking on a window next to each slide, through a drop-down menu, or in any other suitable manner. For instance, the author can chose slides 1, 3 and 7 and those become packaged in the presentation. Or the author can unselect 3 and select another slide, for instance slide 8. The fact that the audio is tied to a slide, as opposed to across the
20 entire presentation, allows the author to chose the order and the slides to be included in the presentation. System 20 extracts the necessary information from the selected slides only when packaging the presentation.

25 The packaged presentation is then subjected to the above-described export process, in which the necessary information is extracted from the playlist object and put into a template-defined format suitable for display within a browser. In one embodiment, system 20 stores the title of each slide in a suitable file for creating the table of contents, and strips all of the text from
30 each slide and stores the text in another file, as is described above. The information proceeds to the packaging process which, as described in detail above, takes the files and subdirectories,

5 including the media file and the slides, and creates an executable file.

10 The packaging process gathers a relatively large number of files, for example as many as 30 to 40 individual files, that are created by system 20 when a slide presentation is created. There may also be other files, such as external files, that also need to be included in a presentation. The packaging process gathers the external files along with the presentation files and creates a single, simplified package. In a preferred embodiment, the packaging and unpackaging functions are completed without interfacing with the author. One of the files in the package is designated as the file to be opened when the package is extracted. A marker is also placed in the executable file that identifies the file as one that is compatible with the application of the present system.

20 Referring now to FIG. 13, there is shown a portion of the presentation, for example when an author has selected the Preview option. The presentation includes a table of contents 400 that includes the title for each of the slides. Each title may be clicked on to immediately display the corresponding slide. In addition, the presentation displays one of the slides 21. Moreover, the presentation includes a window 402 into which the recipient may enter a text string to be searched for. A Search button 404 is provided and may be selected by the recipient to begin a search for text, as is described above in more detail. The search results are displayed in a portion of the screen 406. In one embodiment, if there is a match, the slide that contains the matched text is automatically retrieved and displayed, along with the corresponding audio clip. Alternatively, the results may be

5 displayed for the recipient, with the recipient then selecting one of the slides for display. The display preferably also includes a Play button 408, Pause button 410, and running indicator bar 412 to indicate the current state of the presentation.

10 While the above description has focused primarily on a presentation consisting of screen slides and corresponding audio, it will be readily understood by those having ordinary skill in the art that the various aspects of the present invention have utility in connection with other data-presenting formats. For example, the present invention may be used to export, package, unpackage, and display presentations consisting of spread sheets and corresponding audio clips for one or more of the respective cells in the spread sheet, word processing documents with corresponding audio clips for the various pages of the document, charts, screen capture scenarios, and the like. It will be understood that the various aspects of the invention, including the packaging process, export process, ununpacking process, and event handling process, have utility in connection with various different types of information, and that the screen slide presentation described herein is but one illustrative embodiment of the utility of the invention. Thus, the export process, packaging process, ununpacking process, and event handling process can each be used in connection with various types of information.

30 By way of example, in the case of a spreadsheet, the present invention may be used to add audio clips (e.g., voice comments) to particular cells within the spreadsheet, in a similar manner to the audio clips being associated with the respective screen slides. The invention will concatenate the audio clips into a file, compress the file, and assemble the compressed file, spreadsheet

5 graphics file, and the other files described above into a single, executable file.

10 In addition, a word processing document can be associated with one or more audio clips, wherein the audio clips are linked to particular pages, chapters, paragraphs, and the like, of the document. The export process, packaging process, and unpackaging process are carried out in much the same way as in the case of the screen slide presentation.

15 As used herein, the term "digital asset" is defined as a collection of data that is presented to a viewer, such as a screen slide, a video clip, an audio clip, a spreadsheet, a word processing document, and the like.

20 As described above, in the case of a presentation consisting of plural screen slides, the text from each screen slide is preferably extracted and stored in a data file, with such data being available for searching during subsequent presentation. Where the invention is dealing with other types of digital assets, some other type of data may be extracted from the respective assets for use in intelligently navigating through the presentation. For example, in the case of a video signal, closed captioning information may be extracted from the video and stored in the data file. Alternatively, selected video frames may be extracted and stored, such as transitory frames or other important frames. Moreover, in the case of audio data, key words may be extracted from the audio and stored in the data file.

30 In addition, while the above description focuses primarily on audio clips being linked to respective digital assets (e.g., screen slides, video clips, and the like), the audio clips can be replaced with any continuous stream media format, such as video, audio and

5 video, animations, telemetry, and the like. Thus, the invention
has utility with any continuous stream media format, and it will be
understood by those skilled in the art that audio clips are but one
example thereof.

10 From the foregoing, it will be apparent to those skilled in
the art that the system and method of the present invention provide
for creating a multi-media presentation in a user-friendly,
efficient manner. The system also provides a presentation that can
be searched to arrive at desired subject matter.

15 While the above description contains many specific features of
the invention, these should not be construed as limitations on the
scope of the invention, but rather as exemplary embodiments
thereof. Many other variations are possible. Accordingly, the
scope of the invention should be determined not by the embodiments
illustrated, but by the appended claims and their legal
20 equivalents.

5 WHAT IS CLAIMED IS:

1. A method for processing a plurality of files to create a single, executable file, comprising:

creating a single output file;

copying executable code to the output file;

10 writing destination information to the output file to designate the destination directory of the executable file;

writing plural blocks of data to the output file, each block containing identification information and corresponding data;

15 writing a block containing a clean-up program to the output file if the destination information corresponds to a temporary file; and

writing auto-start file information to the output file to designate a file to be opened when the output file is executed, if an auto-start file is specified by an author.

20 2. The method of claim 1, wherein writing plural blocks comprises writing the corresponding data in a compressed format.

25 3. The method of claim 1, wherein writing the blocks comprises writing a block start flag for each block.

4. The method of claim 1, further including receiving user input to identify the destination directory.

5 5. The method of claim 1, further including writing a source-identifying block to the output file to indicate the source of the file.

10 6. The method of claim 1, further including:
 running the executable code to identify one of the blocks;
 processing identification information contained in the block to determine the contents of the block;
 reading the data in the block and creating a corresponding directory if the block is a destination directory block;
15 decompressing the data in the block and writing the decompressed data to an appropriate directory if the block is a compressed file block;
 writing the data in the block to a temporary directory if the block contains a clean-up program; and
20 saving the information in the block if the information contains auto-start path information.

 7. The method of claim 6, further including:
 beginning a display of data at a preselected position;
25 determining a current position of the display;
 comparing the determined position with a set of event data for the respective digital assets;
 displaying one of the digital assets based on the comparison of the position with the event data;

5 calculating a timeout based on the determined position and the
event data;
 setting a clock to fire upon reaching the timeout;
 initiating a polling process when the clock fires to determine
the position of the display;
10 displaying a different digital asset based on a comparison of
the determined position with the event data; and
 calculating a new timeout and resetting the clock to fire upon
reaching the new timeout.

15 8. The method of claim 6, wherein reading the data further
comprises determining whether the data corresponds to a temporary
directory, and creating an entry to execute the clean-up program if
the data corresponds to a temporary directory.

20 9. The method of claim 6, further including determining
whether the clean-up program is needed, and writing the clean-up
program to the temporary directory only if it is needed.

25 10. The method of claim 6, further including determining,
after the blocks have been written to the appropriate destinations,
if an auto-start file is specified, and opening the auto-start file
if it is specified.

30 11. The method of claim 6, further including processing a
source-identifying block to verify the source of the executable
file.

5 12. A method of unpackaging and launching an executable file,
comprising:

 providing the executable file including executable code and a
plurality of blocks of data;

 running the executable code to identify one of the blocks;

10 processing identification information contained in the block
to determine the contents of the block;

 reading the data in the block and creating a corresponding
directory if the block is a destination directory block;

15 decompressing the data in the block and writing the
decompressed data to an appropriate directory if the block is a
compressed file block;

 writing the data in the block to a temporary directory if the
block contains a clean-up program; and

20 saving the information in the block if the information
contains auto-start path information.

25 13. The method of claim 12, wherein reading the data further
comprises determining whether the data corresponds to a temporary
directory, and creating an entry to execute the clean-up program if
the data corresponds to a temporary directory.

 14. The method of claim 12, further including determining
whether the clean-up program is needed, and writing the clean-up
program to the temporary directory only if it is needed.

30

5 15. The method of claim 12, further including determining,
after the blocks have been written to the appropriate destinations,
if an auto-start file is specified, and opening the auto-start file
if it is specified.

10 16. The method of claim 12, further including processing a
source-identifying block to verify the source of the executable
file.

**SYSTEM FOR MANIPULATION AND INTERACTION OF
TIME-BASED MIXED MEDIA FORMATS**

ABSTRACT OF THE DISCLOSURE

A system and method for efficiently creating a multi-media presentation, as well as allowing for searching through the presentation to retrieve and display desired subject matter within the presentation. The invention provides software that allows a user to record audio clips for one or more of the screens of the presentation, in any order, and in various manners. In addition, the invention maintains a searchable text file to allow a user to find desired subject matter within the presentation, and to display the corresponding screen(s).

FIG. 13

**DECLARATION AND POWER OF ATTORNEY
FOR PATENT APPLICATIONS**

PATENT

Docket No. : 40288/DWR/D453

As a below named inventor, I hereby declare that:

My residence, post office address and citizenship are as stated below next to my name.

I believe I am the original, first and sole inventor (if only one name is listed below) or an original, first and joint inventor (if plural names are listed below) of the subject matter which is claimed and for which a patent is sought on the invention entitled **SYSTEM AND METHOD FOR ASSEMBLING DISCRETE DATA FILES INTO AN EXECUTABLE FILE AND FOR PROCESSING THE EXECUTABLE FILE**, the specification of which is attached hereto unless the following is checked:

___ was filed on ___ as United States Application Number or PCT International Application Number ___ and was amended on ___ (if applicable).

I hereby state that I have reviewed and understand the contents of the above-identified specification, including the claims, as amended by any amendment referred to above.

I acknowledge the duty to disclose information which is material to patentability as defined in 37 CFR § 1.56.

I hereby claim foreign priority benefits under 35 U.S.C. § 119(a)-(d) or § 365(b) of the foreign application(s) for patent or inventor's certificate, or § 365(a) of any PCT International application which designated at least one country other than the United States, listed below and have also identified below, any foreign application for patent or inventor's certificate, or PCT International application having a filing date before that of the application on which priority is claimed.

Prior Foreign Application(s)

<u>Application Number</u>	<u>Country</u>	<u>Filing Date (day/month/year)</u>	<u>Priority Claimed</u>
---------------------------	----------------	-------------------------------------	-------------------------

I hereby claim the benefit under 35 U.S.C. § 119(e) of any United States provisional application(s) listed below.

<u>Application Number</u>	<u>Filing Date</u>
---------------------------	--------------------

I hereby claim the benefit under 35 U.S.C. § 120 of any United States application(s), or any PCT International application designating the United States, listed below and, insofar as the subject matter of each of the claims of this application is not disclosed in the prior United States or PCT International application in the manner provided by the first paragraph of 35 U.S.C. § 112, I acknowledge the duty to disclose information which is material to patentability as defined in 37 CFR § 1.56 which became available between the filing date of the prior application and the national or PCT International filing date of this application:

<u>Application Number</u>	<u>Filing Date</u>	<u>Patented/Pending/Abandoned</u>
---------------------------	--------------------	-----------------------------------

POWER OF ATTORNEY: I hereby appoint the following attorneys and agents of the law firm CHRISTIE, PARKER & HALE, LLP to prosecute this application and any international application under the Patent Cooperation Treaty based on it and to transact all business in the U.S. Patent and Trademark Office connected with either of them in accordance with instructions from the assignee of the entire interest in this application;

**DECLARATION AND POWER OF ATTORNEY
FOR PATENT APPLICATIONS**

Docket No. 40288/DWR/D453

or from the first or sole inventor named below in the event the application is not assigned; or from __ in the event the power granted herein is for an application filed on behalf of a foreign attorney or agent.
